

What is Naloxone?

Naloxone (also called Narcan) is a safe, effective medication that can save a life by stopping an opioid overdose. Paramedics and ambulances carry naloxone. If you use opioids, or know others who do, you can get naloxone from a doctor to use in case of overdose.

Naloxone is injected with a syringe into a muscle in the thigh or upper arm. It can also come in a nasal spray or an auto-injector. It cannot be taken by mouth.

Prevention Point Pittsburgh offers trainings on how to prevent overdose, what to do if someone overdoses, and how to use naloxone.

Where To Get Naloxone

You can get naloxone through Prevention Point at the needle exchange. If you complete a 20-minute training on Overdose Prevention & Response, you can be prescribed naloxone and get it to take home at no charge.

You may also be able to get naloxone from your own doctor. Some doctors are offering naloxone to their patients when opioids are prescribed to treat pain.

Some pharmacies now sell naloxone (or bill insurance) without you having to see a doctor first. Ask your pharmacy if they have a "standing order" for naloxone.

If someone
OVERDOSED
would YOU know
what to do?

This could help you
SAVE A LIFE!

WHO CAN OVERDOSE?

Anyone who uses drugs or medications can overdose. Opioid overdose can cause death because you can stop breathing.

WHAT ARE OPIOIDS?

Medicines for pain: Vicodin, Codeine, OxyContin, Percocet, Opana, Methadone, and Fentanyl. Heroin is also an opioid.

WHAT ARE THE RISKS OF OVERDOSE?

- If you mix opioids with alcohol or medication that has a "downer" or relaxing effect (Xanax, Ativan, Klonopin, Valium or even sleeping pills).
- If you have been opioid-free for a while, and then take drugs or pain medicine, you are more likely to overdose. *Take less than you are used to.*
- If you don't know how potent the drug is, it is easy to take too much. Heroin is "cut" with sugar, baking soda, or other things and depending on the mix it can be stronger or weaker. *If you aren't sure how strong it is, take less to start.*
- Pills also come in different strengths. OxyContin can be a 10mg pill or an 80mg pill. *Big difference!* Know what you are taking.
- If you take drugs or pain medications, try to be with other people who can help you if something goes wrong.

ARE THEY BLUE? PASSED OUT? SLEEPING?

If they took pills, drugs, medication, it could be an overdose! Are they:

- Not breathing, slow breathing?
- Lips or skin look blue or gray?
- Eyes rolled back?
- Limp, unresponsive?
- Slow pulse, no pulse?

WHAT TO DO?

- DON'T LEAVE THEM ALONE TO SLEEP IT OFF.
- Try to wake them. Shake them. Call their name.
- Are they breathing? Put your ear close to their mouth. Can you hear or feel them breathing?
- If not, BREATHE FOR THEM (rescue breathing), and call 911.
- If they have naloxone and you know how to use it, give them an injection into the muscle (thigh or upper arm) or use the nasal spray.

BREATHE FOR THEM It Can Save a Life.

- Roll them on their back
- Tilt their head back
- Remove anything in their mouth
- Pinch their nose shut
- Take a deep breath and breathe into their mouth, 2 breaths to start, then 1 breath every 4 seconds.

Breathing for them can keep them alive, but it's hard to do for long, so call 911 ASAP!

CALL 911 It Can Save a Life.

- Paramedics have oxygen and naloxone and can take them to the hospital.
- When you call 911, the police may come too. Sometimes people are afraid to call 911 for fear of getting in trouble, but if you don't call, the person could die.

ADMINISTER NALOXONE It Can Save a Life.

- If you have naloxone and you know how to use it, you can save a life.
- Available in nasal spray and injection.
- Contact Prevention Point Pittsburgh to receive instruction for administering naloxone.
